

Features

- **1.8V Single Supply**
- **Eight sensor inputs**
- **Capacitance resolution up to 0.59aF**
- **Capacitance offset compensation up to 800pF**
- **Support fully differential input mode**
- **Smart SAR detection engine**
- **Advanced ambient environment compensation algorithm**
- **Automatic adaptive threshold and sensitivity levels**
- **Programmable detection range**
- **Programmable scan period from 2ms to 4s**
- **Ultra-low EMI mode by enable spread spectrum**
- **Integrated temperature sense ADC for temperature compensation**
- **Three level user proximity interrupts**
- **Low Power consumption**
 - Scan Mode: 25 uA
 - Doze Mode: 7 uA
 - Sleep Mode: 3 uA
- **Support up to 400kHz I2C Serial Interface**
- **Support 1.2V~3.6V IO voltage**
- **Programmable Interrupt or Real-Time Status Pin**
- **-40°C to +85°C Operation**
- **Compact Size: 1.8mm x 1.9 mm QFN12 package**

Applications

Smart Phone, PAD, TWS
Head Phone, Smart Wearable

Description

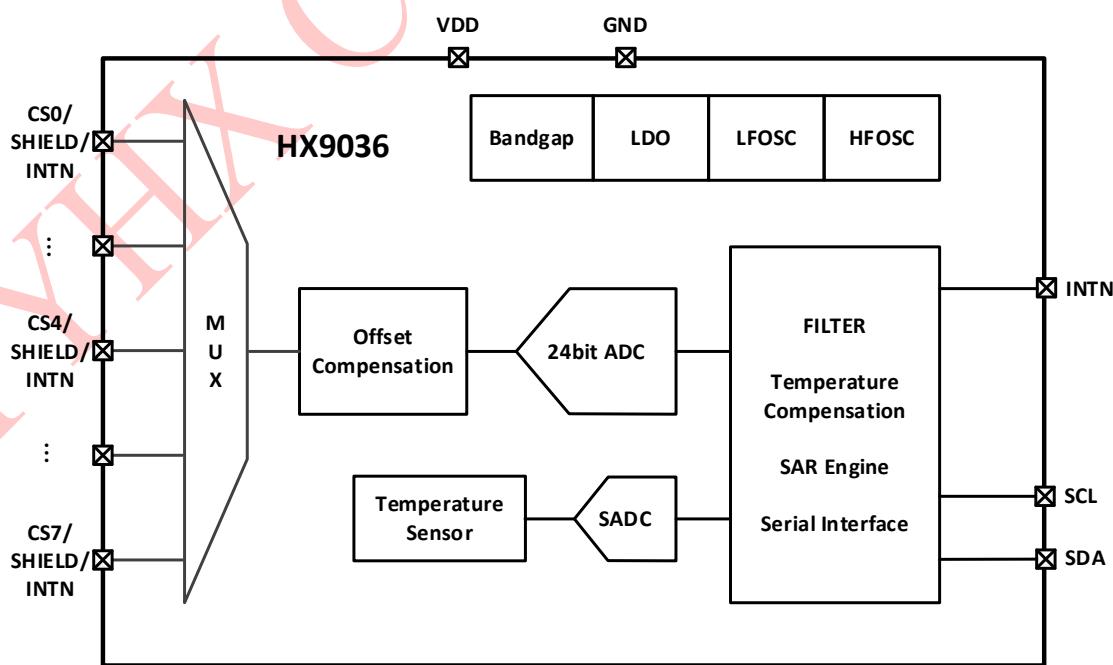

The HX9036 integrates a capacitance sense AFE used for Specific Absorption Rate (SAR) application.

The HX9036 supports up to eight sensor inputs, with an offset compensation capacitance up to 800pF. The HX9036 has high sensitivity which enables the detection of human body proximity. The portable electronic device can reduce the emission power upon the presence of human body according to the detection result of HX9036. This will bring significant performance advantages for manufacturers of electronic devices with electro-magnetic radiation sources to meet stringent emission regulations' criteria and Specific Absorption Rate (SAR) standards.

The HX9036 can operate from 1.8V single supply, and it outputs data via I2C bus. The I2C serial communication bus port is compatible with 1.2V~3.6V host control to report user proximity. Upon proximity detection, the INTN output asserts, enabling the user to either determine the relative proximity distance, or simply obtain an indication of detection.

HX9036 has on-chip calibration logic to account for changes in the ambient environment, such as temperature, humidity. The calibration sequence is performed automatically and at continuous intervals, while the sensors are not touched. This ensures that there are no false detections on the external sensors due to the changing environment

3 Detailed Description

3.1 Overview

The HX9036 integrates a capacitance sense AFE used for Specific Absorption Rate (SAR) application. The HX9036 supports up to eight sensor inputs, with an offset compensation capacitance up to 800pF. The HX9036 has high sensitivity which enables the detection of human body proximity. The portable electronic device can reduce the emission power upon the presence of human body according to the detection result of HX9036. This will bring significant performance advantages for manufacturers of electronic devices with electro-magnetic radiation sources to meet stringent emission regulations' criteria and Specific Absorption Rate (SAR) standards.

The HX9036 can operate from 1.8V single supply, and it outputs data via I2C bus. The I2C serial communication bus port is compatible with 1.2V~3.6V host control to report user proximity. Upon proximity detection, the INTN output asserts, enabling the user to either determine the relative proximity distance, or simply obtain an indication of detection.

HX9036 has on-chip calibration logic to account for changes in the ambient environment, such as temperature, humidity. The calibration sequence is performed automatically and at continuous intervals, while the sensors are not touched. This ensures that there are no false detections on the external sensors due to the changing environment.

3.2 Functional Block Diagram

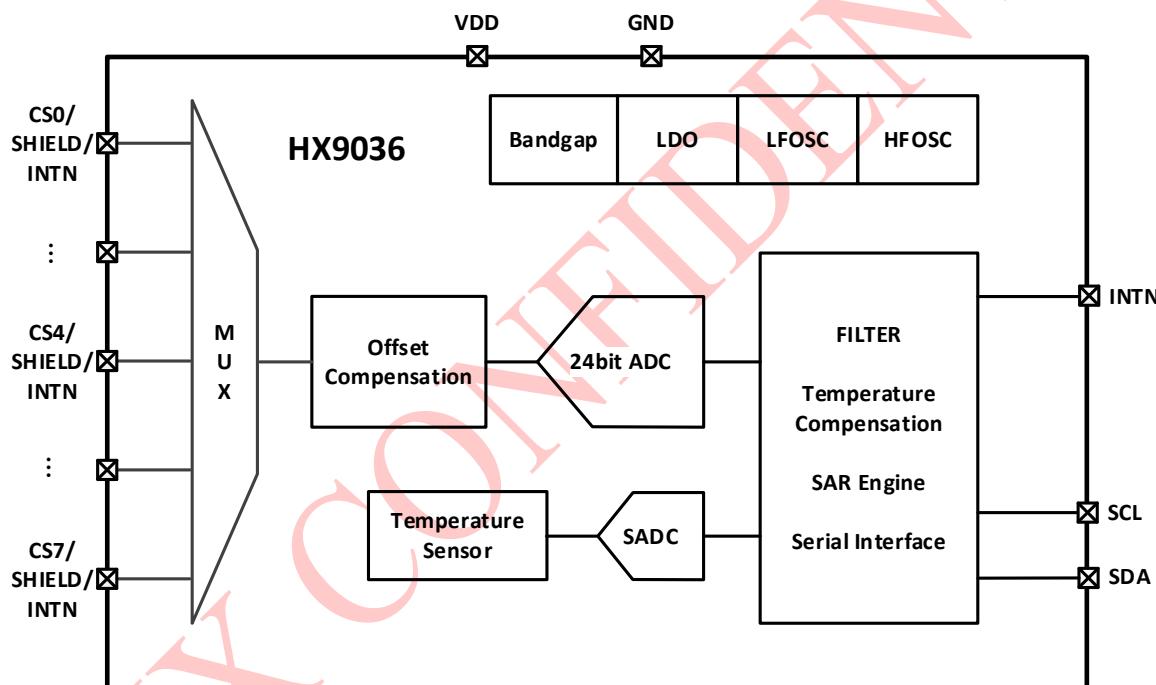

Figure2 Functional Block Diagram

3.3 Working Mode

HX9036 has mainly three operation modes

1 sleep mode: which is configured if no CH_EN is enabled. All the circuits except I2C and 32KHz OSC are shut down and the power consumption is less than 4uA.

2 scan mode: if any of the CH_NUM[7:0] is enabled, HX9036 will go to scan mode, in this mode the chip will periodically detect the capacitance on each sensor (if enabled). The scan period can be configured by register.

3 doze mode: In some applications, the reaction/sensing time needs to be fast when the user is present (proximity detected), but can be slow when no detection has occurred for some time. If DOZE_EN is enabled, the HX9036 will scan each channel (if enabled) by a relatively slow rate, and if user proximity is detected, it will accelerate the scan period and back to slow rate when proximity is released.

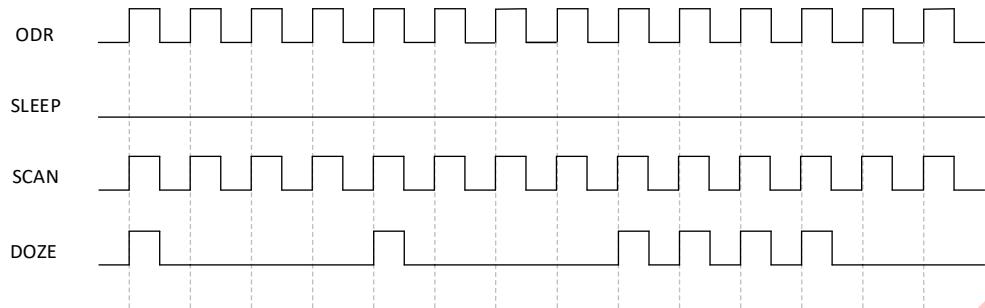

Figure3 Working modes of HX9036

3.4 Timing Diagram

The timing information of HX9036 is as following. The device works under two internal clocks: 32KHz system clock CLK_32K and 5MHz ADC timing clock CLK_5M. The 32KHz clock is running all the time. It controls the scan period configured by register scan_period_i2c. The 5MHz high frequency clock is enabled in scan mode or doze mode. It is used to generate the timing during each conversion.

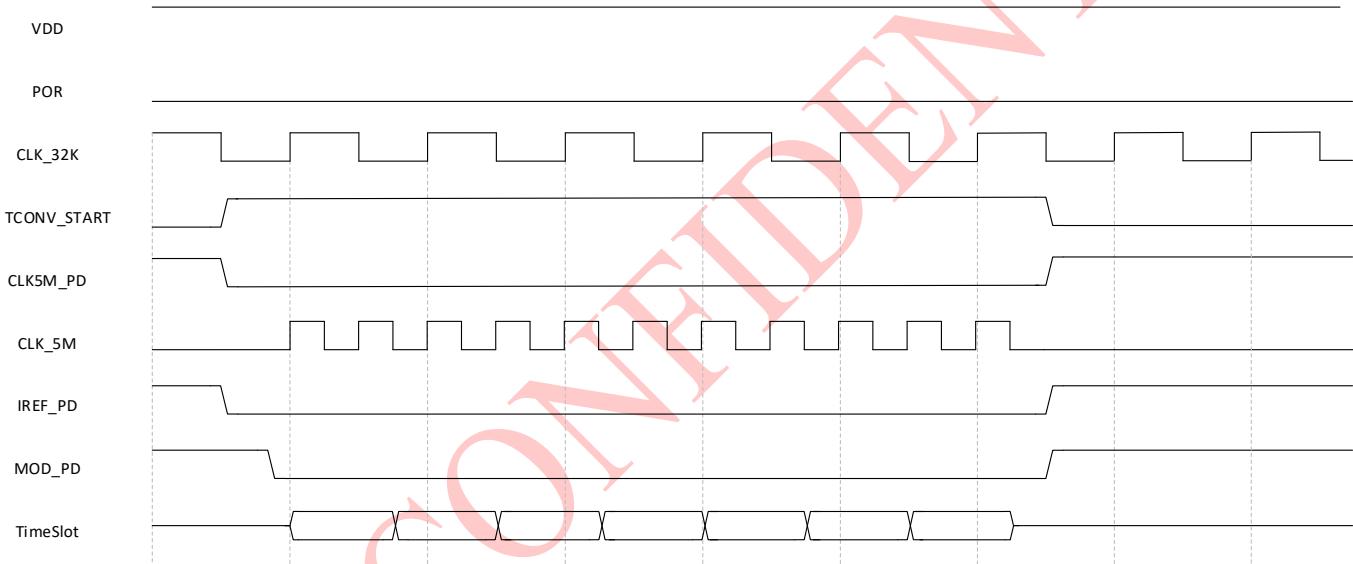

Figure4 Main Timing Diagram

3.5 Analog-to-Digital Converter (ADC)

A delta-sigma ADC is used to convert the input capacitance to a 24bit digital data. The ADC is highly configurable, user can configure the sample frequency, OSR, average time according the application.

The OSR and average number of each channel can be flexible configured through register. This can help the customer optimized the chip performance according different application environment.

Chx_avg_num_i2c: controls the average number of each channel. The down sample filter will output one data after averaged by NAVG times, this will improve the noise performance.

Chx_osr_num_i2c: controls the OSR of the ADC, the OSR can be configured as 64/128/256, depending on the noise and resolution requirement.

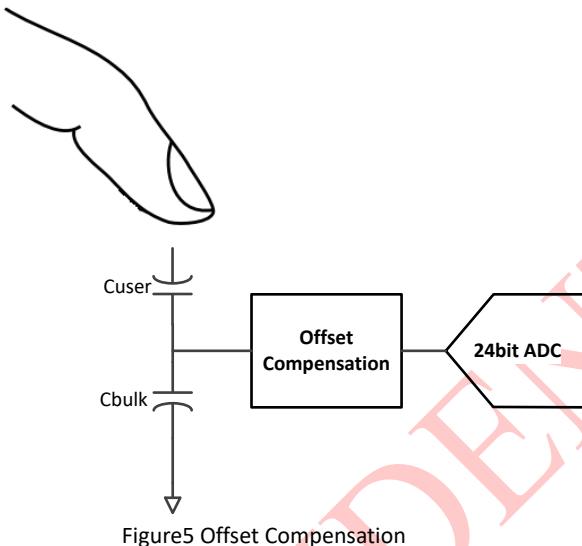

Range_i2c: the full scale of the measurement can be configured separately for each channel. The full scale can be configured as 1.25pF/2.5pF/3.75pF/5pF/10pF depending on the application.

3.6 Offset Capacitance Compensation

The offset compensation scheme is used to compensate the capacitance of the sensor to the environment, i.e. PCB board. After the compensation, only the Cuser is feed into the ADC. HX9036 can compensate up to 800pF parasitic cap. The offset cap calibration will be performed before the first measurement and after the calibration, the offset value will be stored into register for each channel.

There are three sources that will trigger the compensation: 1. The compensation will be required when any of the channel is enabled. The compensation is performed before the first measurement. 2. The compensation can be triggered by the user writing a 1 to offset_cali_en_i2c. The offset calibration engine will start right before the next scan period. 3. The DSP will continuously monitor the drift of the Cbulk, when the drift exceeds a certain level preset by the user, the offset calibration scheme will be performed.

The compensation request flag can be set anytime but the compensation scheme will be performed at the beginning of next scan period to keep all parameters coherent. Also, when compensation occurs, all the data in the low pass filter will be reset.

3.7 Digital Signal Processing

The Digital Signal Processing (DSP) block is incorporated to convert the raw_data from the delta-sigma ADC to a low noise, environment robust prox_diff data which is used to indicate whether a proximity occurs. The offset calibration is performed once before the first measurement. But the environment will vary all the time, the Cbulk will drift along time. The DSP block will continuously monitor the environment drift and filter out the drift to get an environment insensitive prox_diff data.

Figure6 shows the digital processing sequence, after wake up, the digital will repeatedly update the raw_data, prox_diff, pros_stat of each channel.

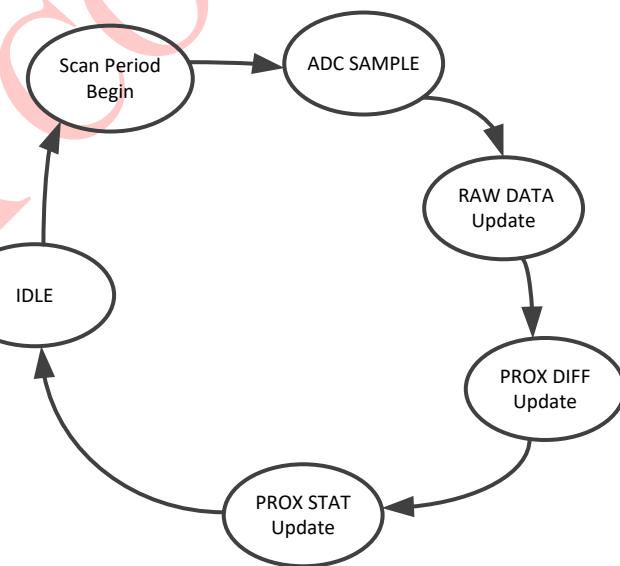

Figure6 Digital Processing Sequence

5 I2C Protocol

5.1 I2C Data format

The I2C bus protocol was developed by Philips (now NXP). The device supports the standard writing and reading protocol. The 7-bit device address is 0x1b. The register index will automatically increase by 1 after the addressed register has been accessed (read or write). And the format is shown as following:

- A Acknowledge (0)
- P Stop Condition
- R Read (1)
- S Start Condition
- W Write (0)
- Sr Repeated Start Condition
- Master-to-Slave
- Slave-to-Master

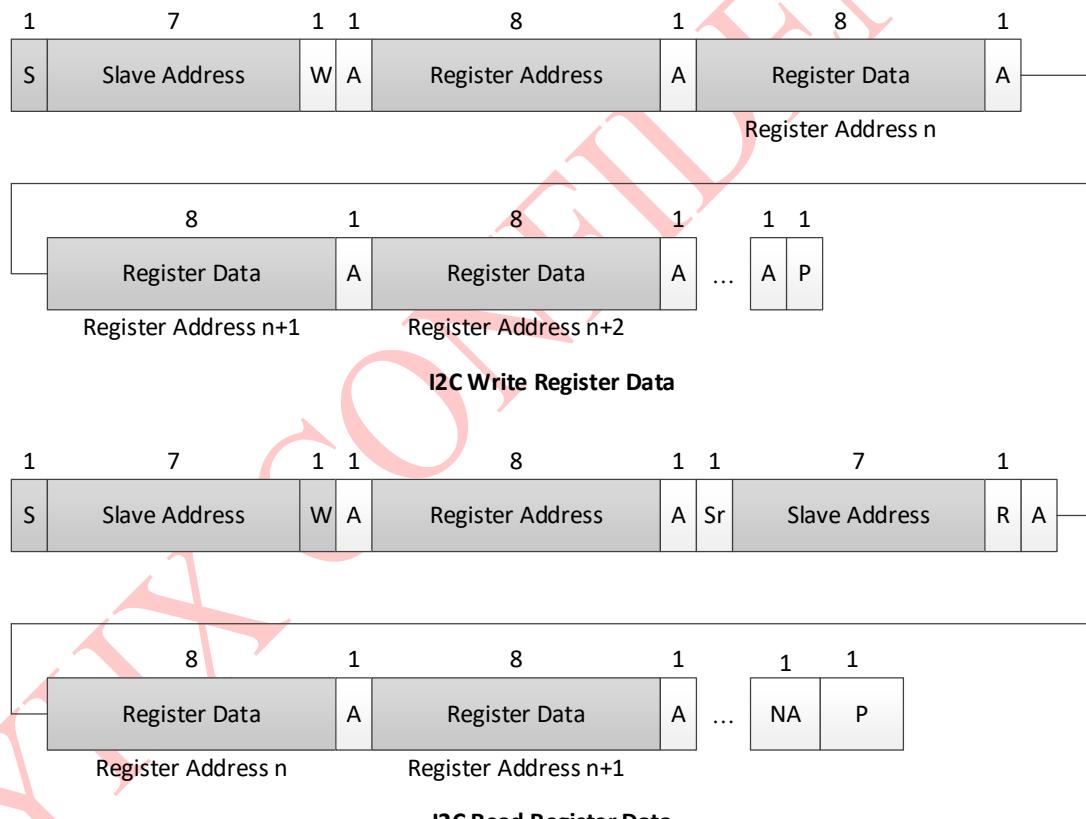

Figure7 I2C data format diagram

5.2 I2C Electrical Characteristics

Table2 I²C Electrical Characteristics

PARAMETER	SYMBOL	STANDARD		FAST		UNIT
		MIN	MAX	MIN	MAX	
LOW level input voltage: fixed input levels VDD-related input levels	VIL	0.5 0.5	1.5 0.3VDD	n/a 0.5	n/a 0.3VDD ⁽¹⁾	V V
HIGH level input voltage: fixed input levels VDD-related input levels	VIH	3 0.7VDD	Note ⁽²⁾ Note ⁽²⁾	3 0.7VDD ⁽¹⁾	n/a Note ⁽²⁾	V V

Hysteresis of Schmitt trigger inputs: VDD > 2 V VDD < 2 V	V _{hys}	n/a n/a	n/a n/a	0.05VDD 0.1VDD	— —	V V
LOW level output voltage (open drain or open collector) at 3 mA sink current: VDD > 2 V VDD < 2 V	V _{O1} V _{O2}	0 n/a	0.4 n/a	0 0	0.4 0.2VDD	V V
Output fall time from V _{IHmin} to V _{ILmax} with a bus capacitance from 10 pF to 400 pF	t _{of}	—	250 ⁽⁴⁾	20+0.1 C _b ⁽³⁾	250 ⁽⁴⁾	ns
Pulse width of spikes which must be suppressed by the input filter	t _{SP}	n/a	n/a	0	50	ns
Input current each I/O pin with an input voltage between 0.1VDD and 0.9VDDmax	I _i	-10	10	-10 ⁽⁵⁾	10 ⁽⁵⁾	A
Capacitance for each I/O pin	C _i	-	10	-	10	pF

Notes

- Devices that use non-standard supply voltage switch don't conform to the intended I²C-bus system levels must relate input levels to the VDD voltage to which the pull-up resistors R_P are connected.
- Maximum V_{IH} = VDDmax + 0.5V.
- C_b = capacitance of one bus line in pF.
- The maximum t_f for the SDA and SCL bus lines quoted in Table3(300ns) is longer than the specified maximum t_{of} for the output stages (250 ns). This allows series protection resistors (R_S) to be connected between the SDA/SCL pins and the SDA/SCL bus lines without exceeding the maximum specified t_f.
- I/O pins of Fast-mode devices must not obstruct the SDA and SCL lines if VDD is switched off.

n/a = not applicable

5.3 I²C Timing

The I²C Timing is as following figure:

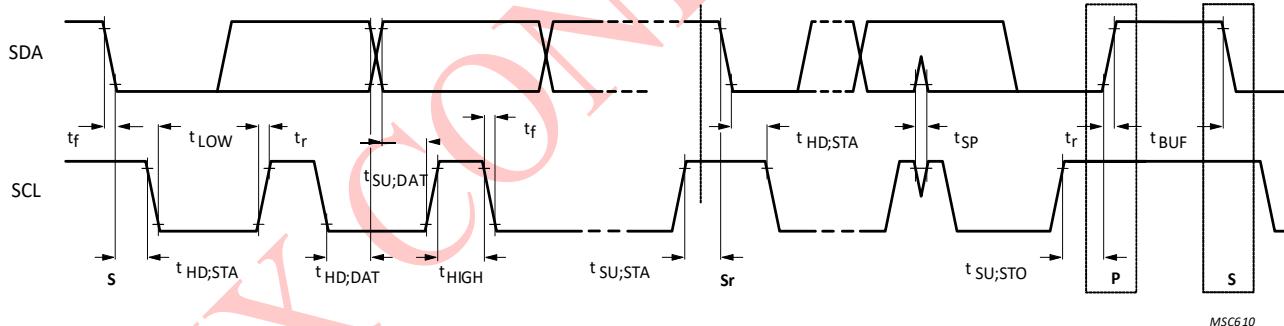

Figure8 I²C Timing

Table3 I²C Timing Parameters⁽¹⁾

PARAMETER	SYMBOL	MIN	MAX	UNIT
SCL clock frequency	f _{SCL}	0	800	kHz
Hold time (repeated) START condition. After this period, the first clock pulse is generated	t _{HD;STA}	0.6	—	us
LOW period of the SCL clock	t _{LOW}	1.3	—	us
HIGH period of the SCL clock	t _{HIGH}	0.6	—	us
Set-up time for a repeated START condition	t _{SU;STA}	0.6	—	us
Data hold time	t _{HD;DAT}	0 ⁽²⁾	—	us
Data set-up time	t _{SU;DAT}	100 ⁽³⁾	—	ns
Rise time of both SDA and SCL signals	t _r	—	300	ns
Fall time of both SDA and SCL signals	t _f	—	300	ns
Set-up time for STOP condition	t _{SU;STO}	0.6	—	us
Bus free time between a STOP and START condition	t _{BUF}	1.3	—	us

Capacitive load for each bus line	C_b	-	400	pF
Noise margin at the LOW level for each connected device (including hysteresis)	V_{nL}	0.1VDD	-	V
Noise margin at the HIGH level for each connected device (including hysteresis)	V_{nH}	0.2VDD	-	V

Notes

1. All values referred to VIHmin and VILmax levels (see Table2).
2. A device must internally provide a hold time of at least 300ns for the SDA signal(referred to the VIHmin of the SCL signal) to bridge the undefined region of the falling edge of SCL.
3. A Fast-mode I2C-bus device can be used in a Standard-mode I2C-bus system, but the requirement $t_{SU;DAT} \geq 250$ ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_{r\ max} + t_{SU;DAT} = 1000 + 250 = 1250$ ns (according to the Standard-mode I2C-bus specification) before the SCL line is released.

6 Application Information

Typical application for HX9036 is showing below:

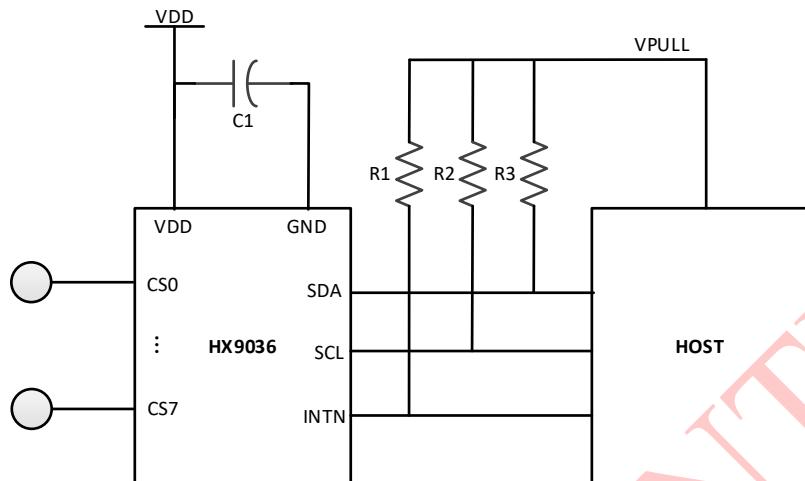

Figure9 Typical Application Schematic

Note:

1. Any CSx pad can be configured as dummy pad and at most eight independent channels can be used simultaneously
- And the device value is listed below:

Table4 I²C Timing Parameters

DEVICE NAME	Value	Description
VDD	1.8V	Low noise
VPULL	1.2~3.6V	
C1	1uF	
R1	2.2 KΩ	
R2	2.2 KΩ	
R3	2.2 KΩ	

7 Package and Reel

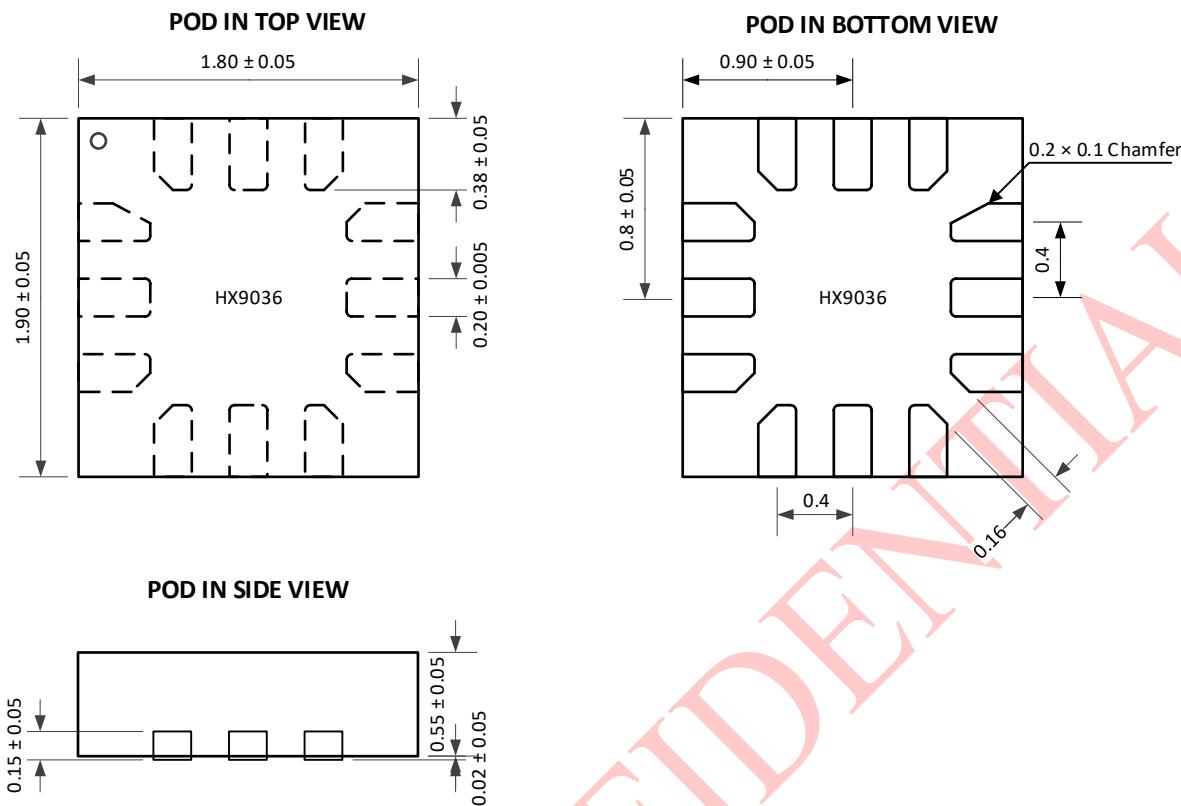

Figure10 Package Information (Unit: mm)

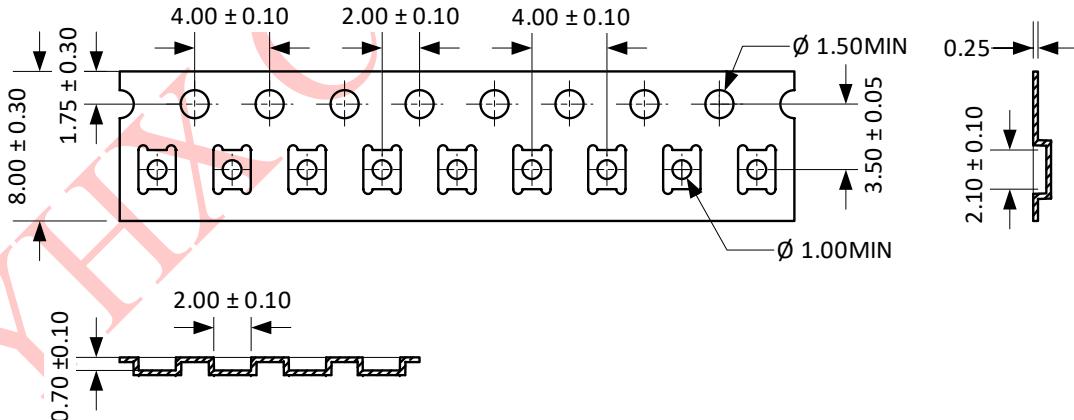

Figure11 Tape Information (Unit: mm)

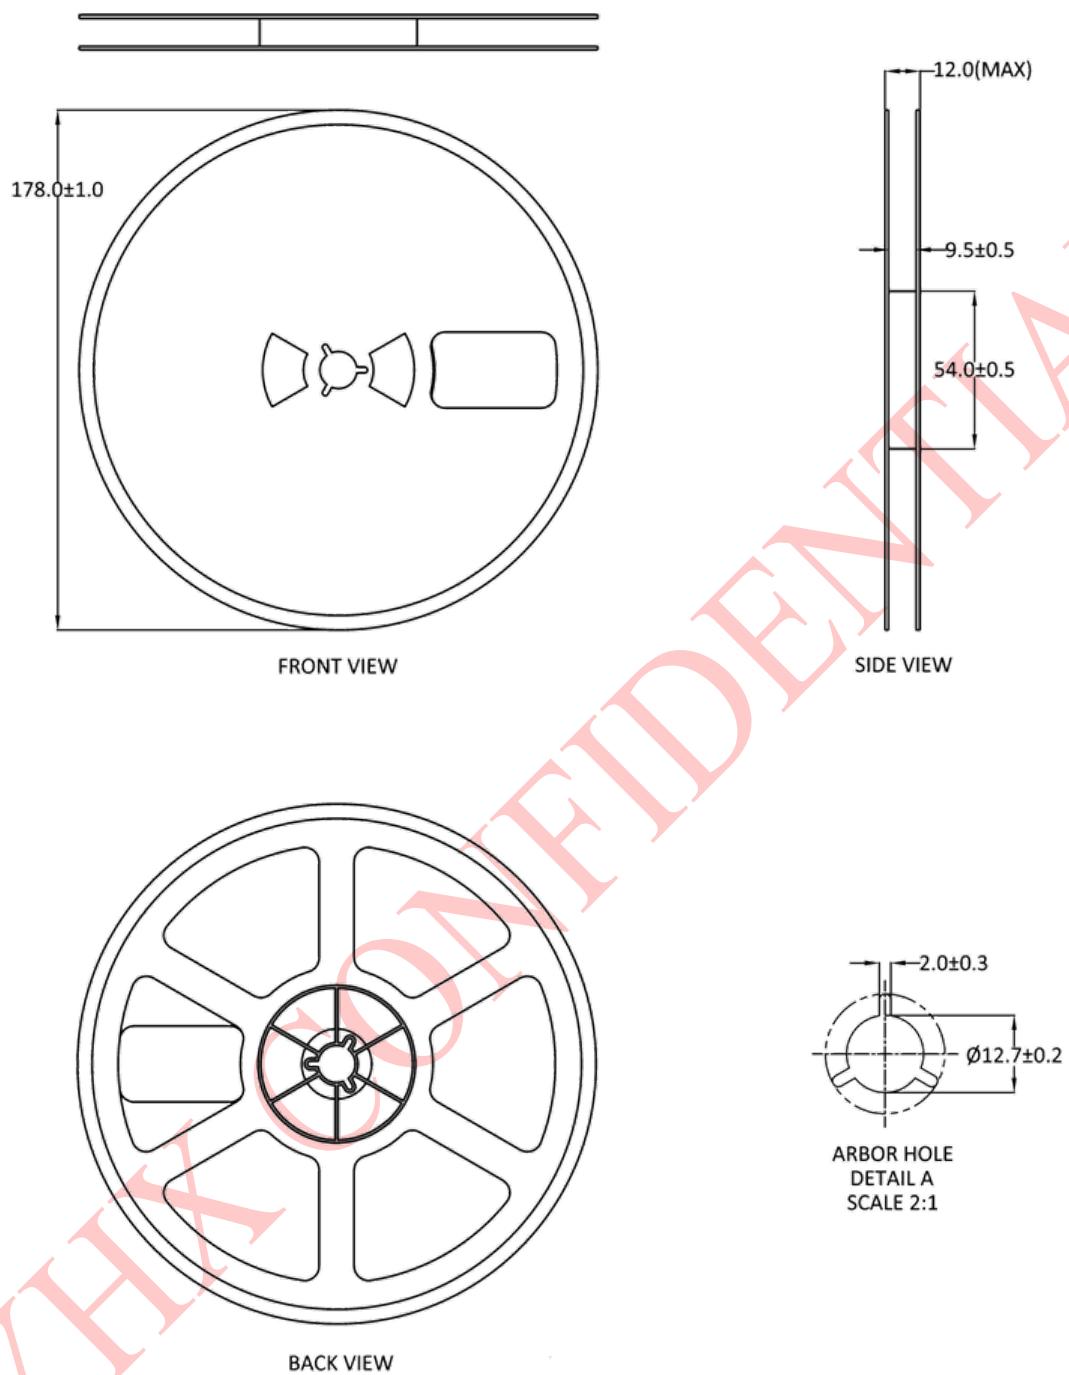

Figure12 Reel Information (Unit: mm)

7.1 Land Pattern

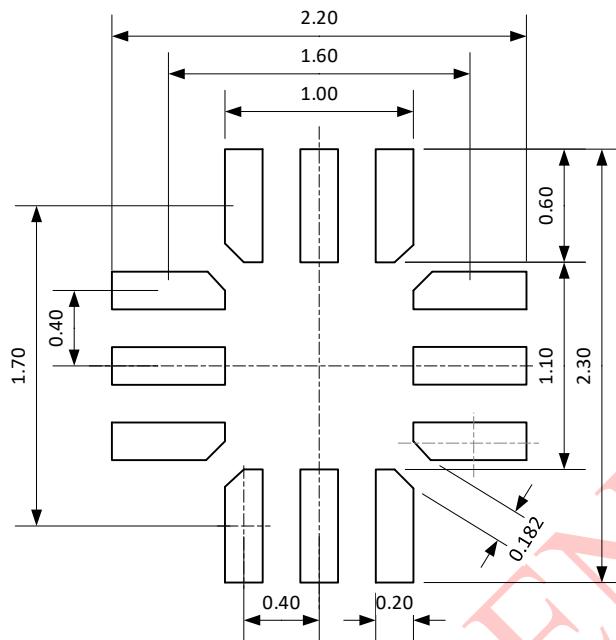

Figure13 Land Pattern

NOTES:

1. Controlling dimensions are in millimeters (angles in degrees).
2. This land pattern is for reference group to ensure your company's manufacturing are met.

8 Soldering Information

The module has been tested and has demonstrated an ability to be reflow soldered to a PCB substrate. The process, equipment, and material used in these tests are detailed below. The solder reflow profile describes the expected maximum heat exposure of components during the solder reflow process of product on a PCB. Temperature is measured on top of component. The components should be limited to a maximum of three passes through this solder reflow profile.

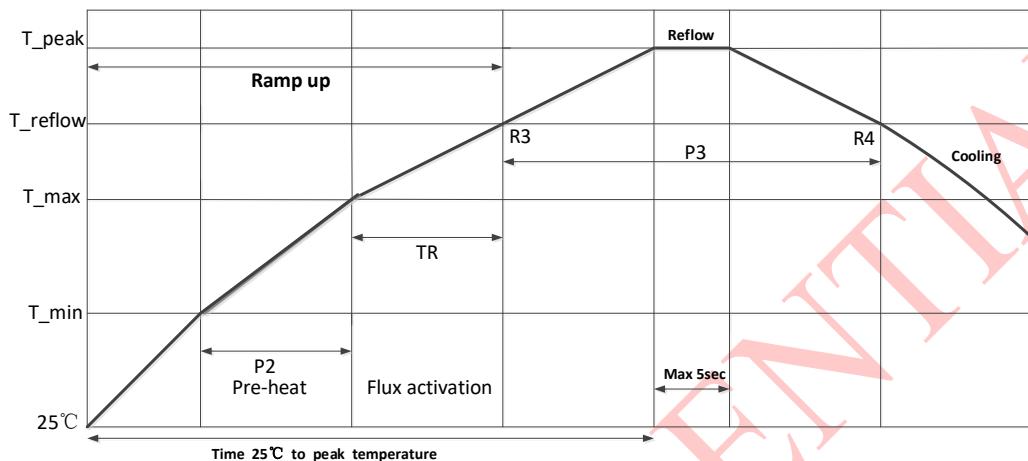

Figure11 Solder reflow profile grape

Table5 Solder Reflow Profile

	Peak temperature (Tpeak)	250-255 °C; Max 5sec
Pre-Heat	Temperature min (Tmin)	150°C; 2 °C/Sec
	Temperature max(Tmax)	150-217°C; 100S to 180S
	P2: (T min to max)	90-110s
Time maintain above	Temperature (Tre flow)	217°C
	Time (P3)	60-90sec
	R3 Slope (from 217°C to peak)	2°C/sec(typ) to 2.5°C/sec(max)
	R4 Slope (from peak to 217°C)	1.5°C/sec(typ) to 4°C/sec(max)
	Time to peak temperature	480s Max
	Cooling down slope (peak to 217°C)	2-4°C/sec

REVISION HISTORY

Version	Date	Comment
1.0	Nov 18, 2021	Initial version
1.1	Jun 15, 2022	Add reel information
1.2	Jun 24, 2022	Add land pattern
1.3	Aug 9, 2022	Add register 0xce~0xd0
1.4	Step 14, 2022	Update register map
